

# Relative merits of different types of observations to constrain galaxy physical parameters

Camilla Pacifici - *Yonsei University Observatory*  
Stephane Charlot, Susan Kassin, Sukyoung Yi

KIAS Workshop - Cosmology and Structure Formation  
1st November 2012, Seoul

# Outline

---

- Motivation
- Modeling approach
- Assess relative merits of different types of observations to constrain physical parameters
- Current and future applications
  - assessing the star formation histories of DEEP2 galaxies

# Motivation

Galaxies...

- how do they form?
- how do they evolve?
- what are they made of?

characterize physical properties of galaxies from their light

**MODELS**

**pseudo data**

*known physical parameters*

*priors*

**real data**

*unknown physical parameters*

**sed-interpretation techniques**

accuracy and uncertainty in estimates of physical parameters

estimates of physical parameters

# Models

---

required to relate observables to physical parameters

build library of galaxy spectra which can best reproduce a wide range of observables

# Models

---

required to relate observables to physical parameters

build library of galaxy spectra which can best reproduce a wide range of observables

star formation and chemical enrichment **histories**

+

emission by the **stars**

+

emission by the **gas**

+

effect of the **dust**

# Models

---

required to relate observables to physical parameters

build library of galaxy spectra which can best reproduce a wide range of observables

star formation and chemical enrichment **histories**

+

emission by the stars

+

emission by the gas

+

effect of the dust

# Library of SF and chemical enrichment histories

Springel et al. (2005)  
Croton et al. (2006)  
De Lucia & Blaizot (2007)

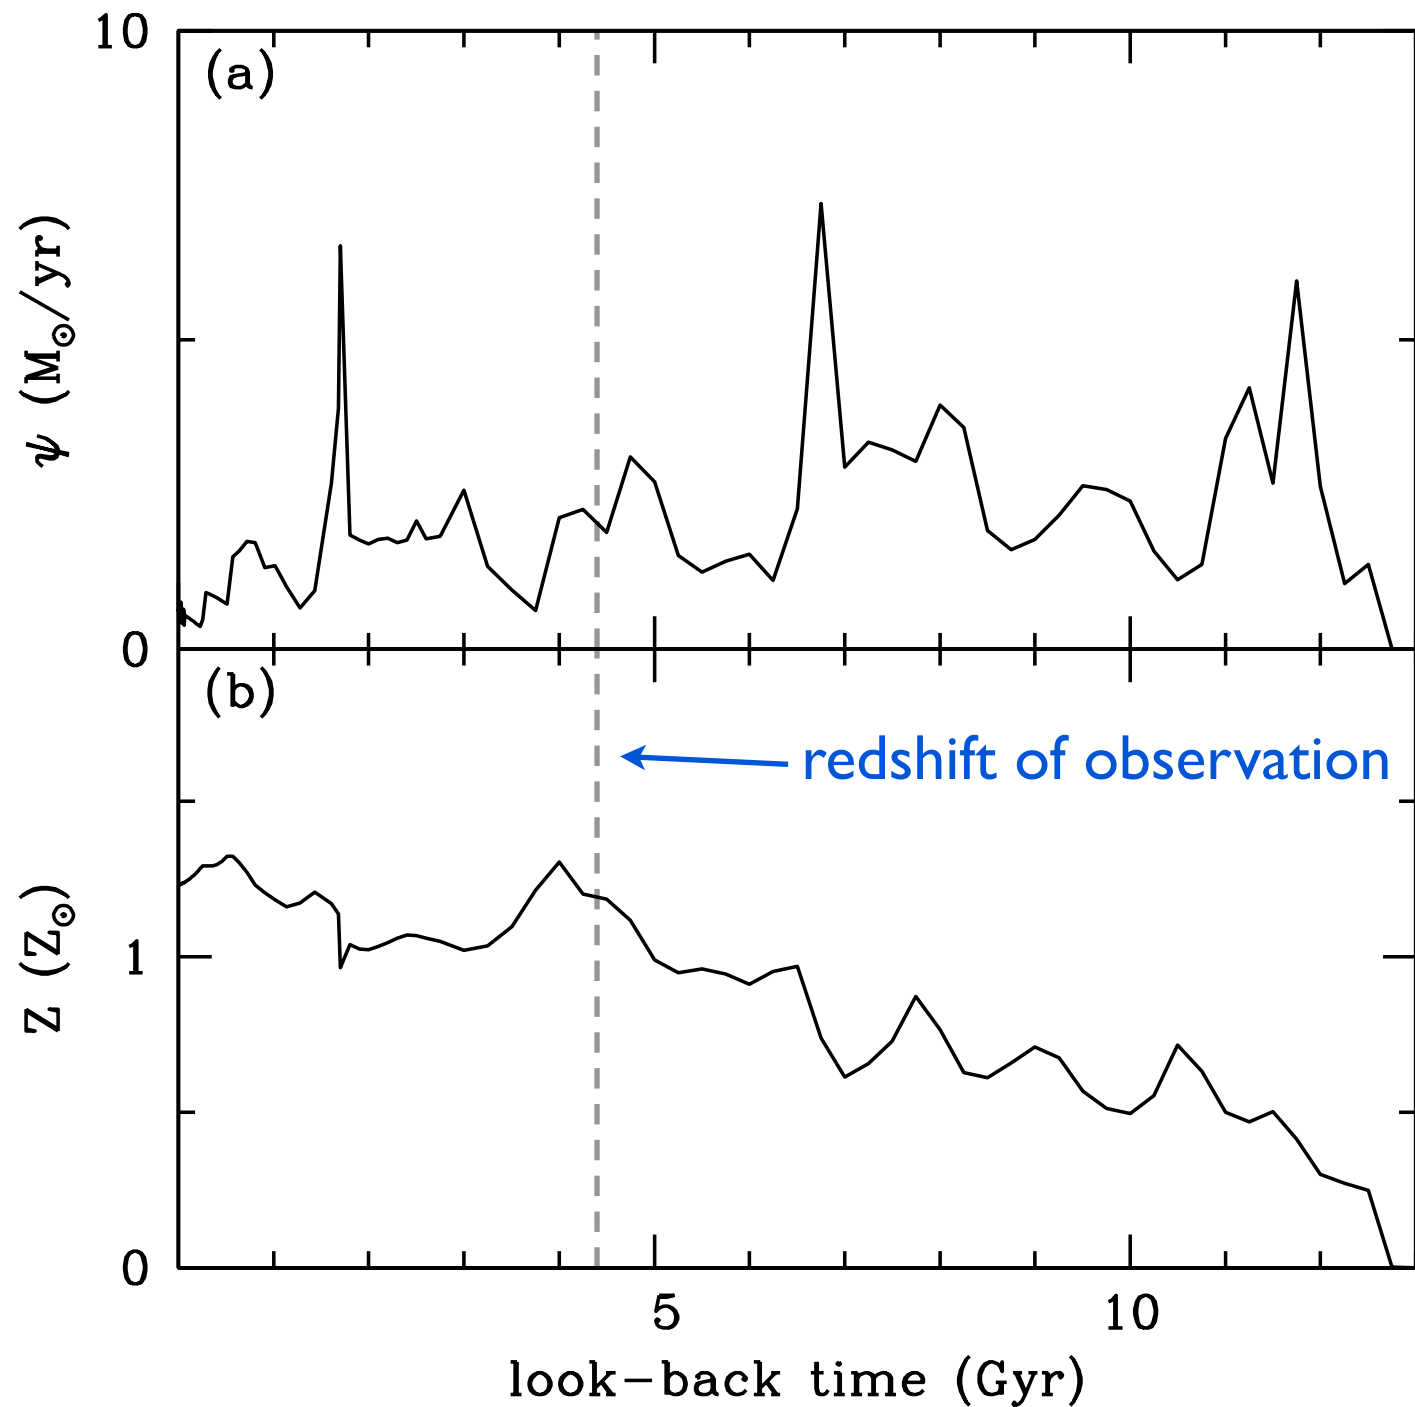

merger tree  
of dark  
matter halos

semi-analytic post-  
processing of the  
**Millennium Simulation**

- minor and major mergers
- trigger of star formation
- AGN and SN feedback

# Library of SF and chemical enrichment histories

semi-analytic post-processing of the  
**Millennium Simulation**

Springel et al. (2005)

Croton et al. (2006)

De Lucia & Blaizot (2007)

draw 5,000,000  
model galaxies in wide  
ranges of physical  
parameters and  
evolutionary stages

# Models

---

required to relate observables to physical parameters

build library of galaxy spectra which can best reproduce a wide range of observables

star formation and chemical enrichment histories

+

emission by the **stars**

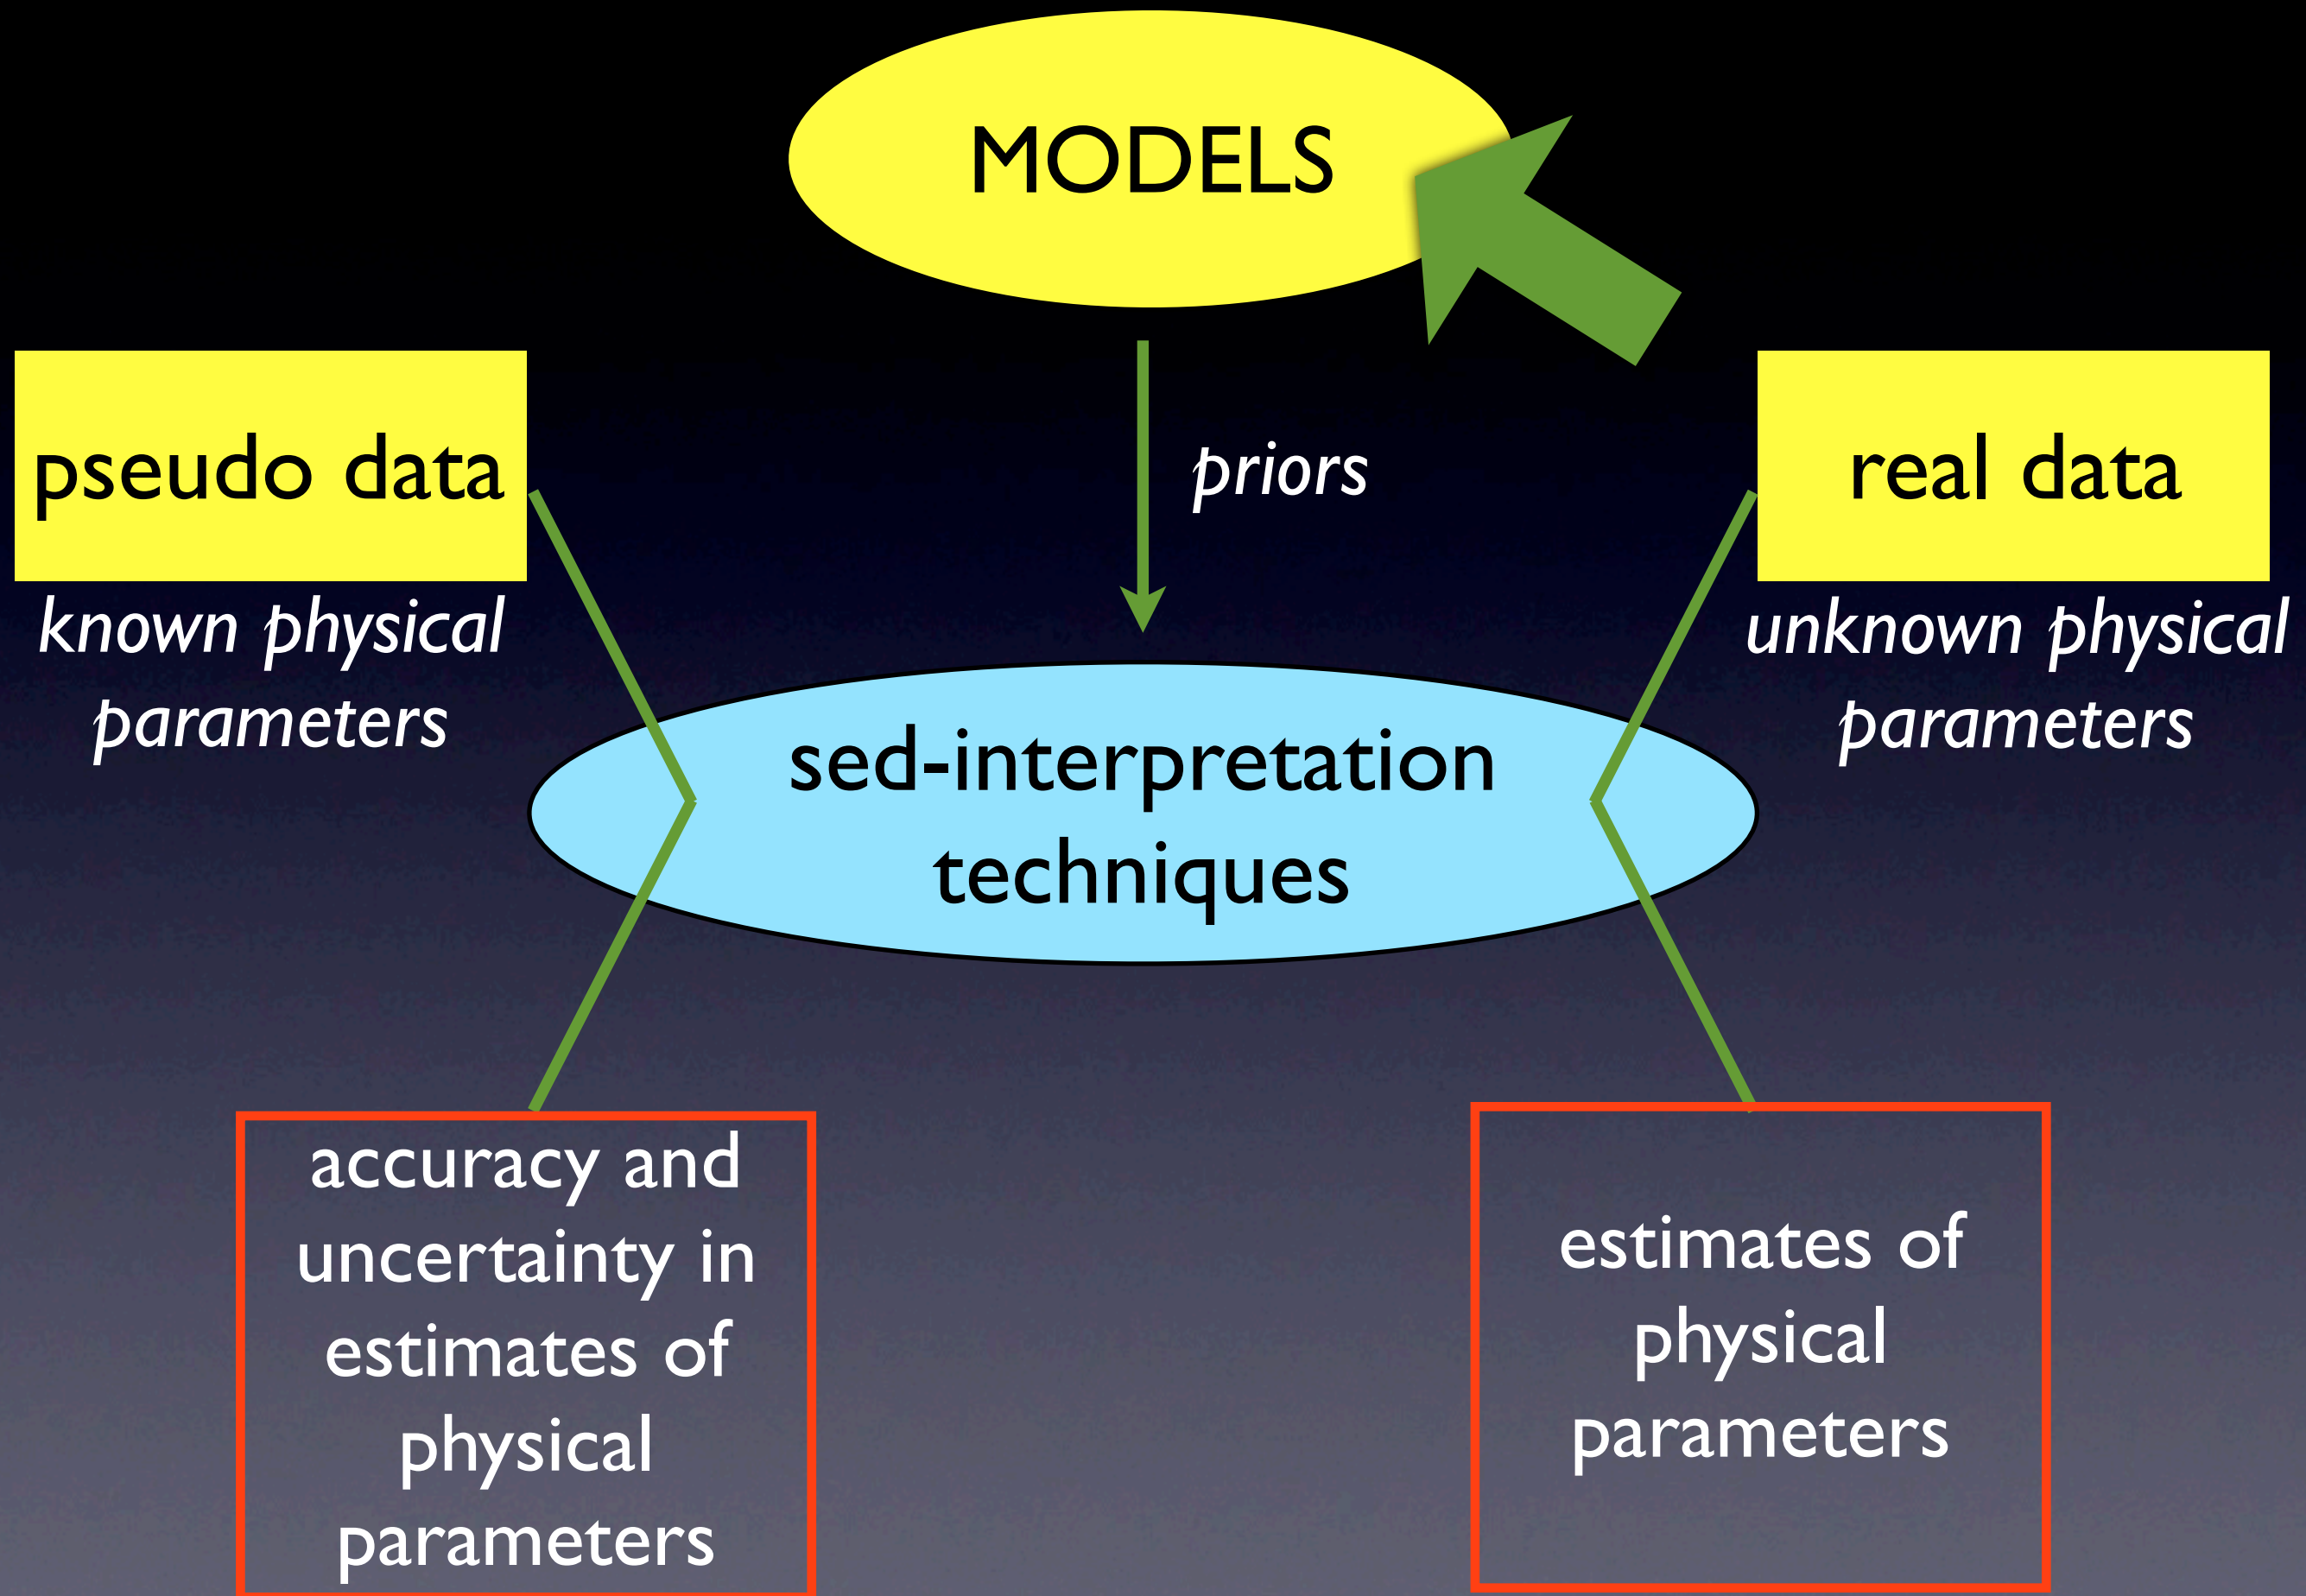

+

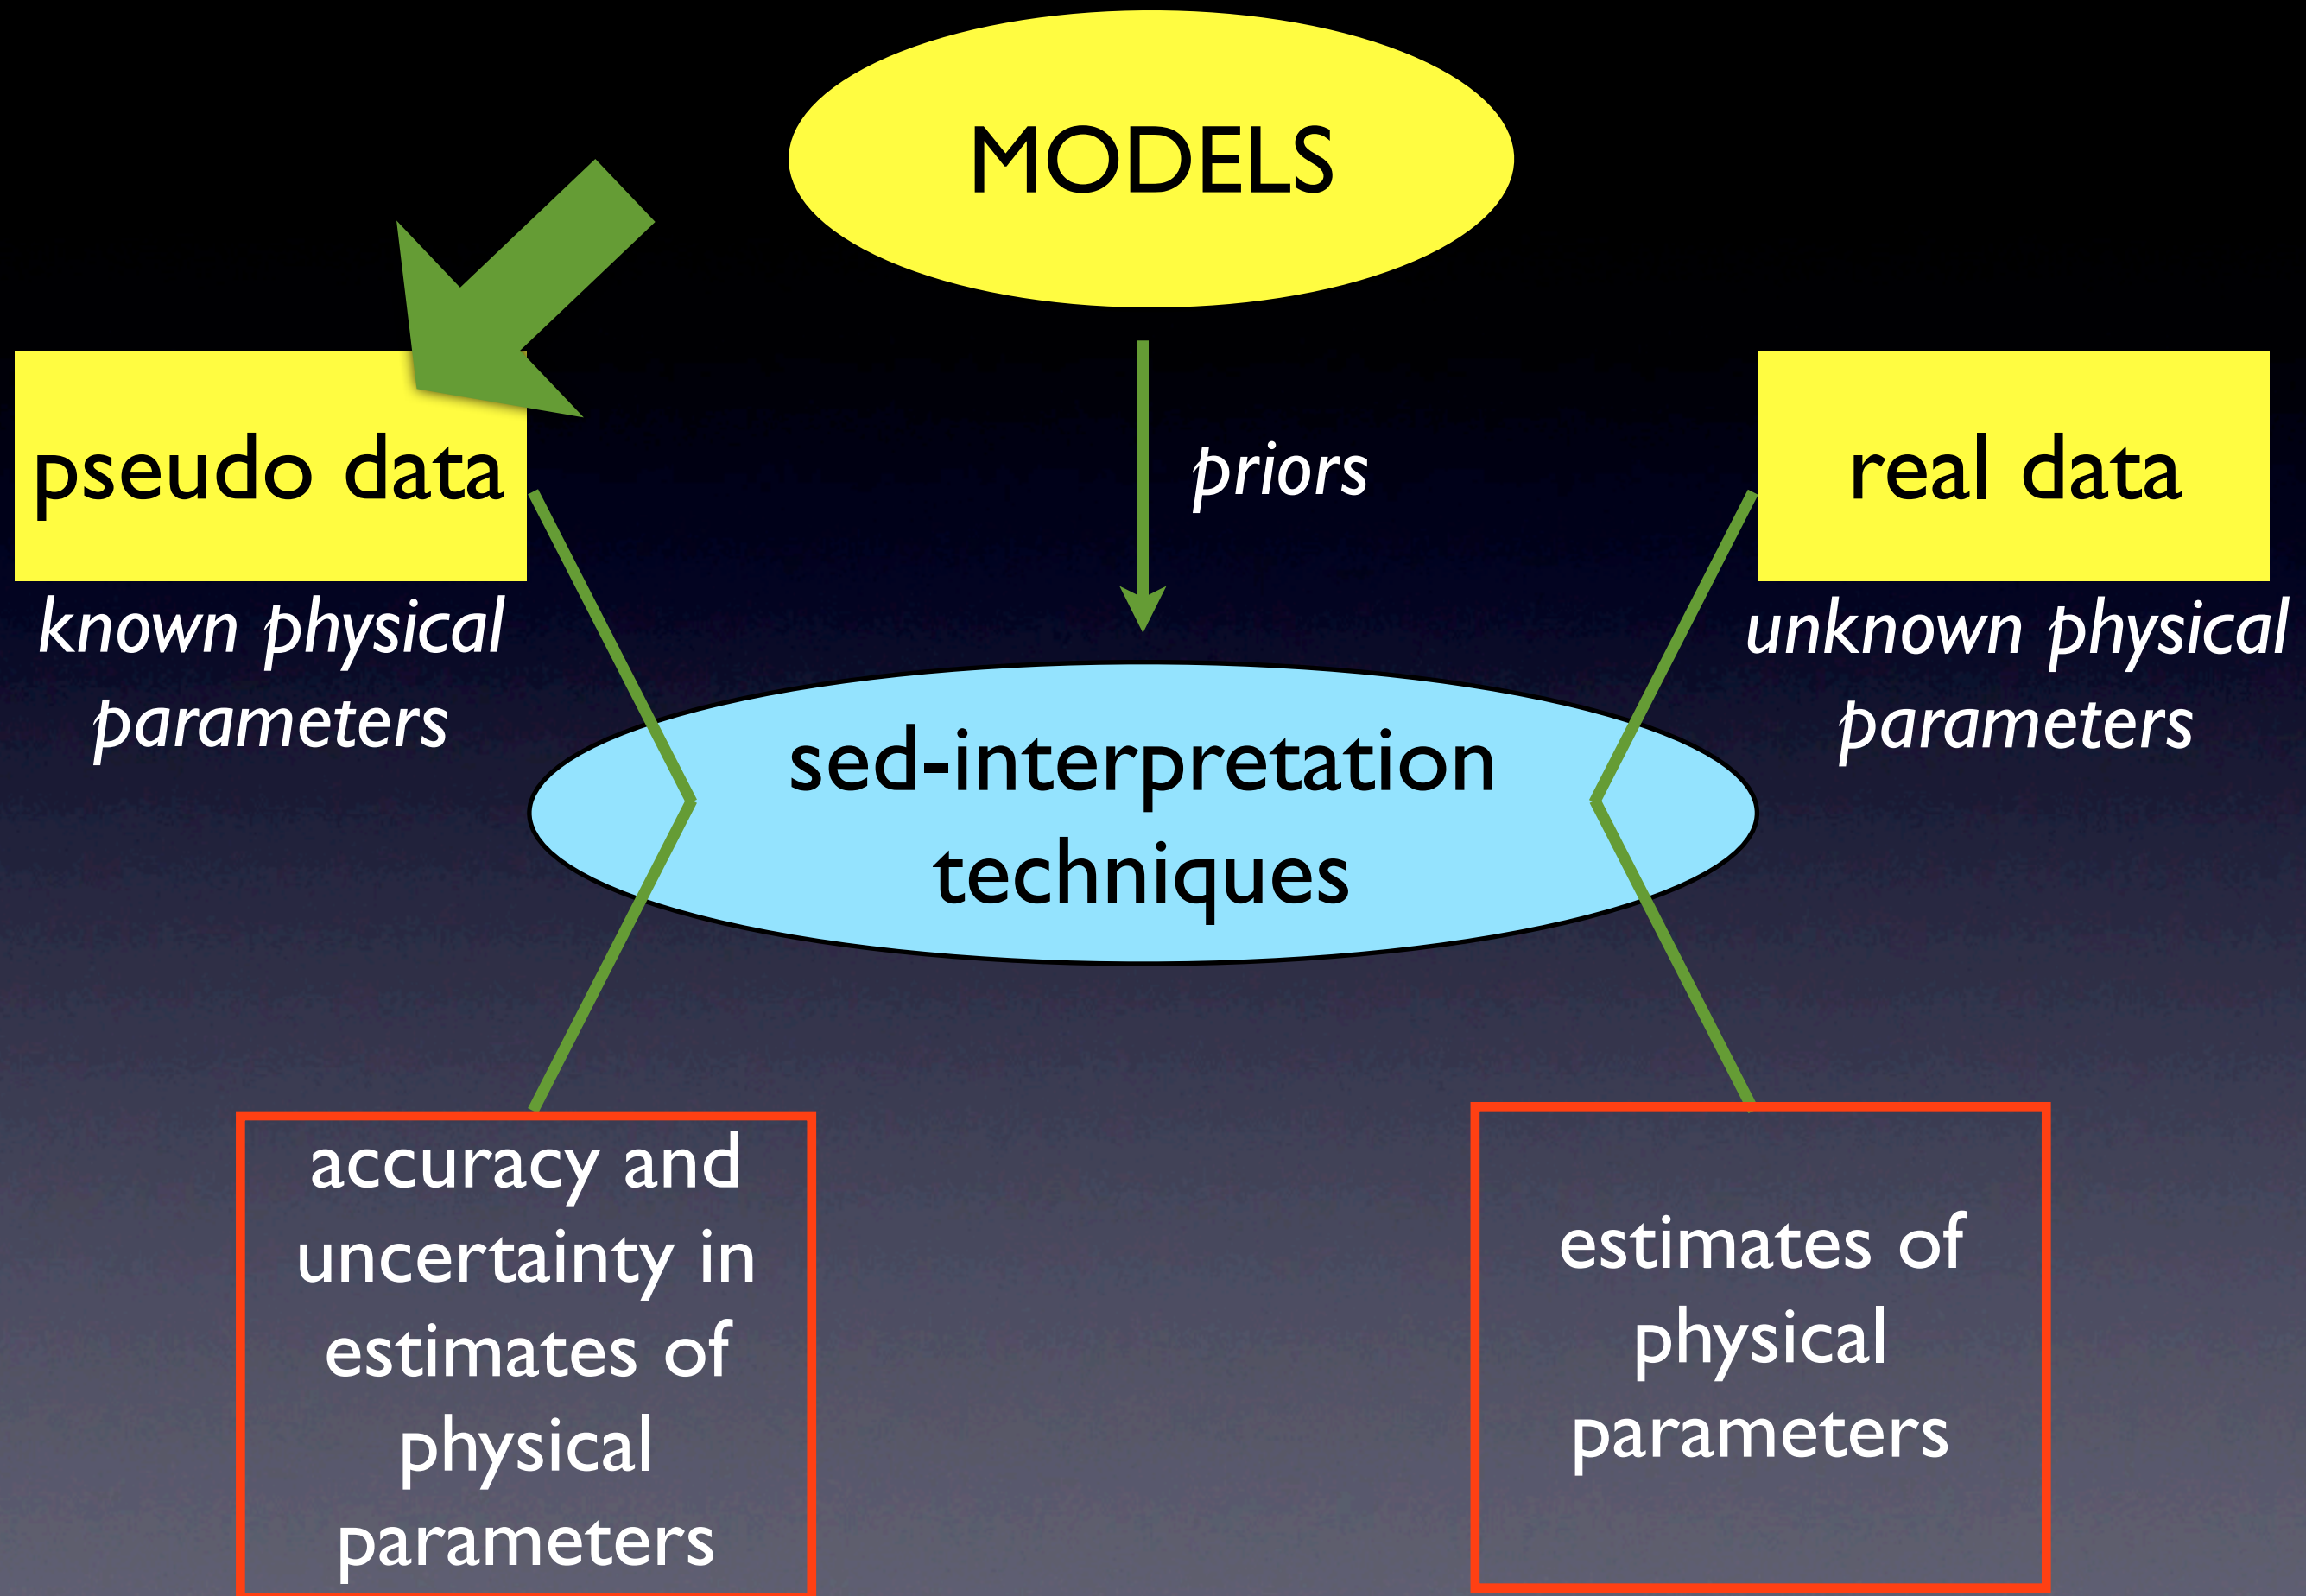

emission by the **gas**

+

effect of the **dust**

# Building pseudo-observations

use these models to generate **SEDs** of 5 million galaxies in the library

estimate physical parameters of observed galaxies by **comparison with every model** in library (Bayesian)

# Building pseudo-observations

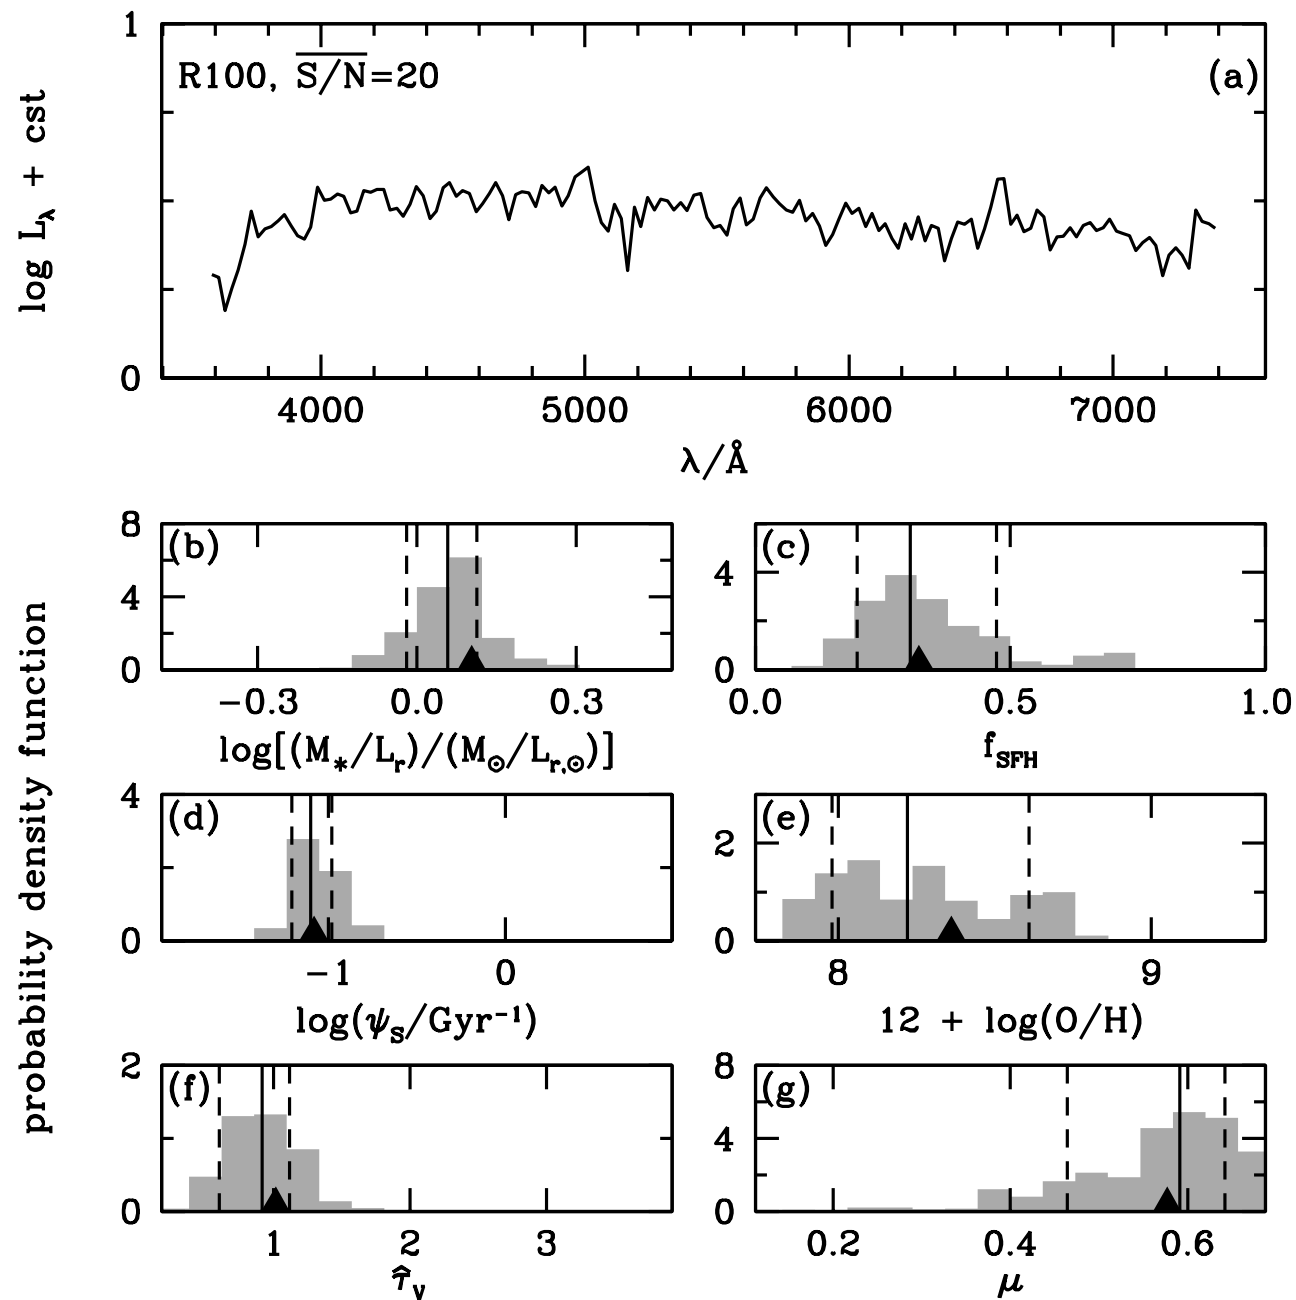

main feature: stellar continuum and nebular emission fitted simultaneously

estimate physical parameters of observed galaxies by comparison with every model in library (Bayesian)

# Example of parameter retrieval

## SPECTRAL FIT

rest-frame optical spectrum  
 $S/N \sim 20$ ,  $R=100$

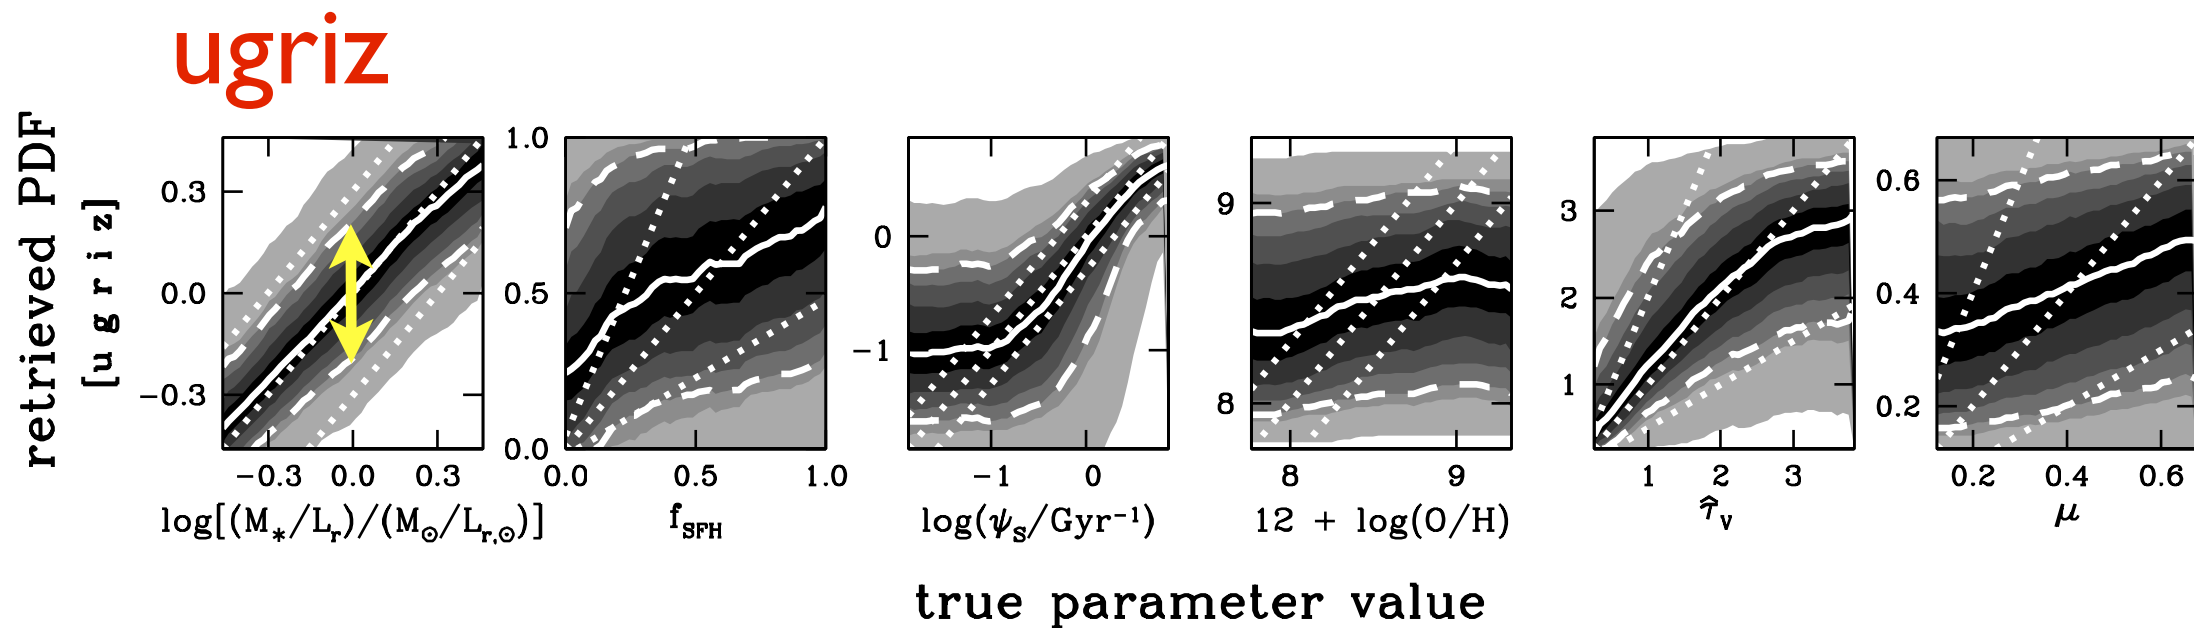

- mass-to-light ratio
- fraction of stellar mass formed in the last 2.5 Gyr
- specific SFR
- gas-phase oxygen abundance
- dust attenuation optical depth
- fraction dust in the ISM

# Parameter retrieval from different types of observations

broad-band photometry *ugriz*

S/N=30

5,000,000 models, 10,000 pseudo-observation

16% - 84% confidence interval

(50% median = best estimate)

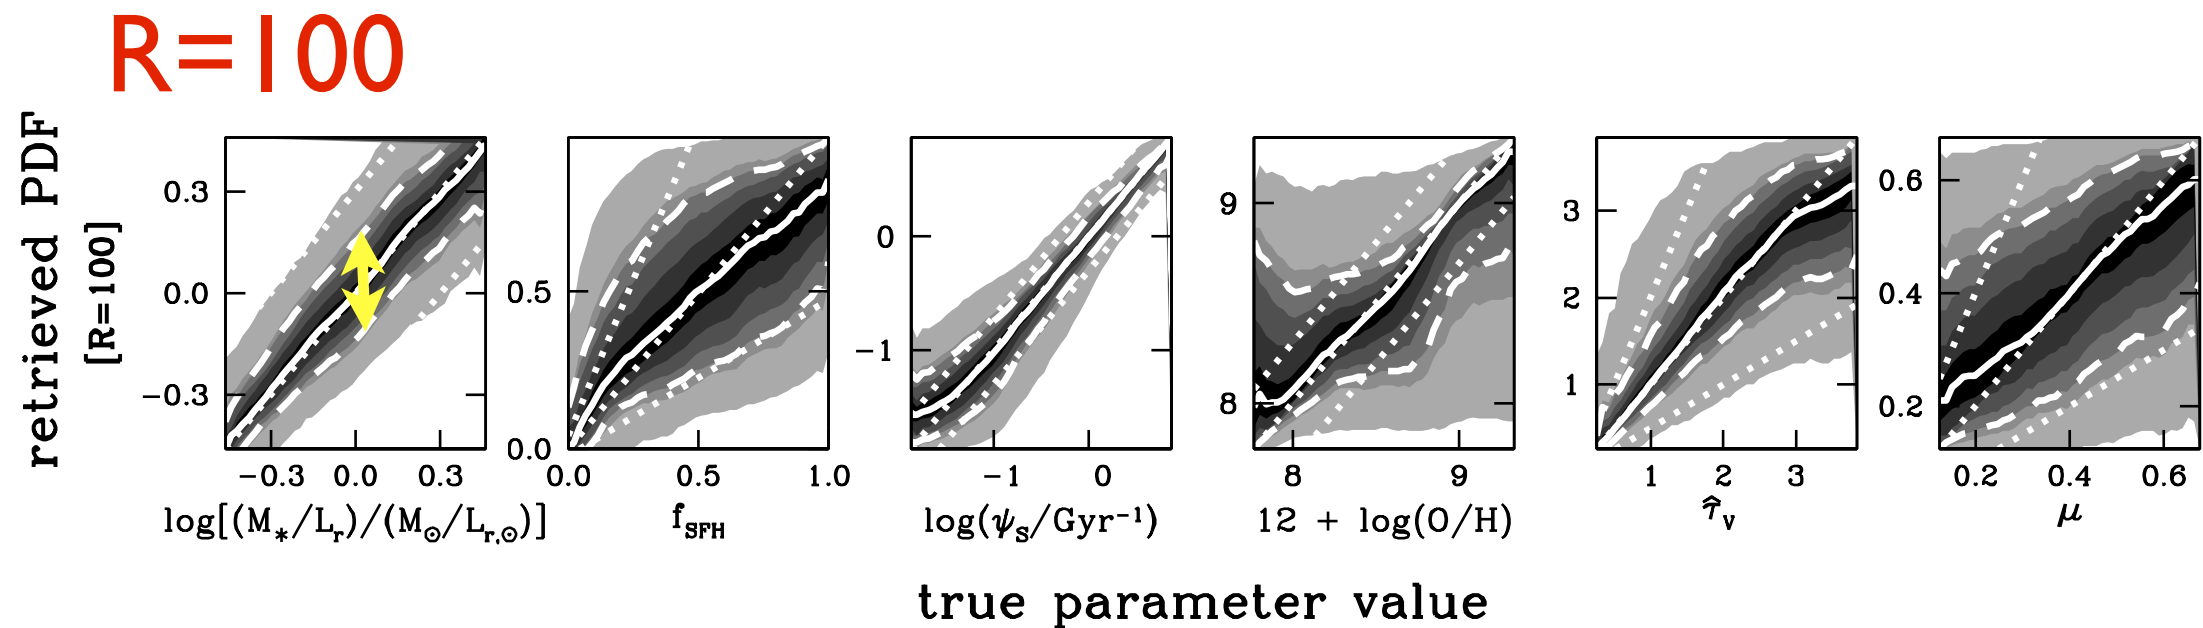

# Parameter retrieval from different types of observations

spectral fit low-resolution ( $R=100$ ,  $\text{FWHM}=50 \text{ \AA}$ )

$S/N=20$

5,000,000 models, 10,000 pseudo-observation

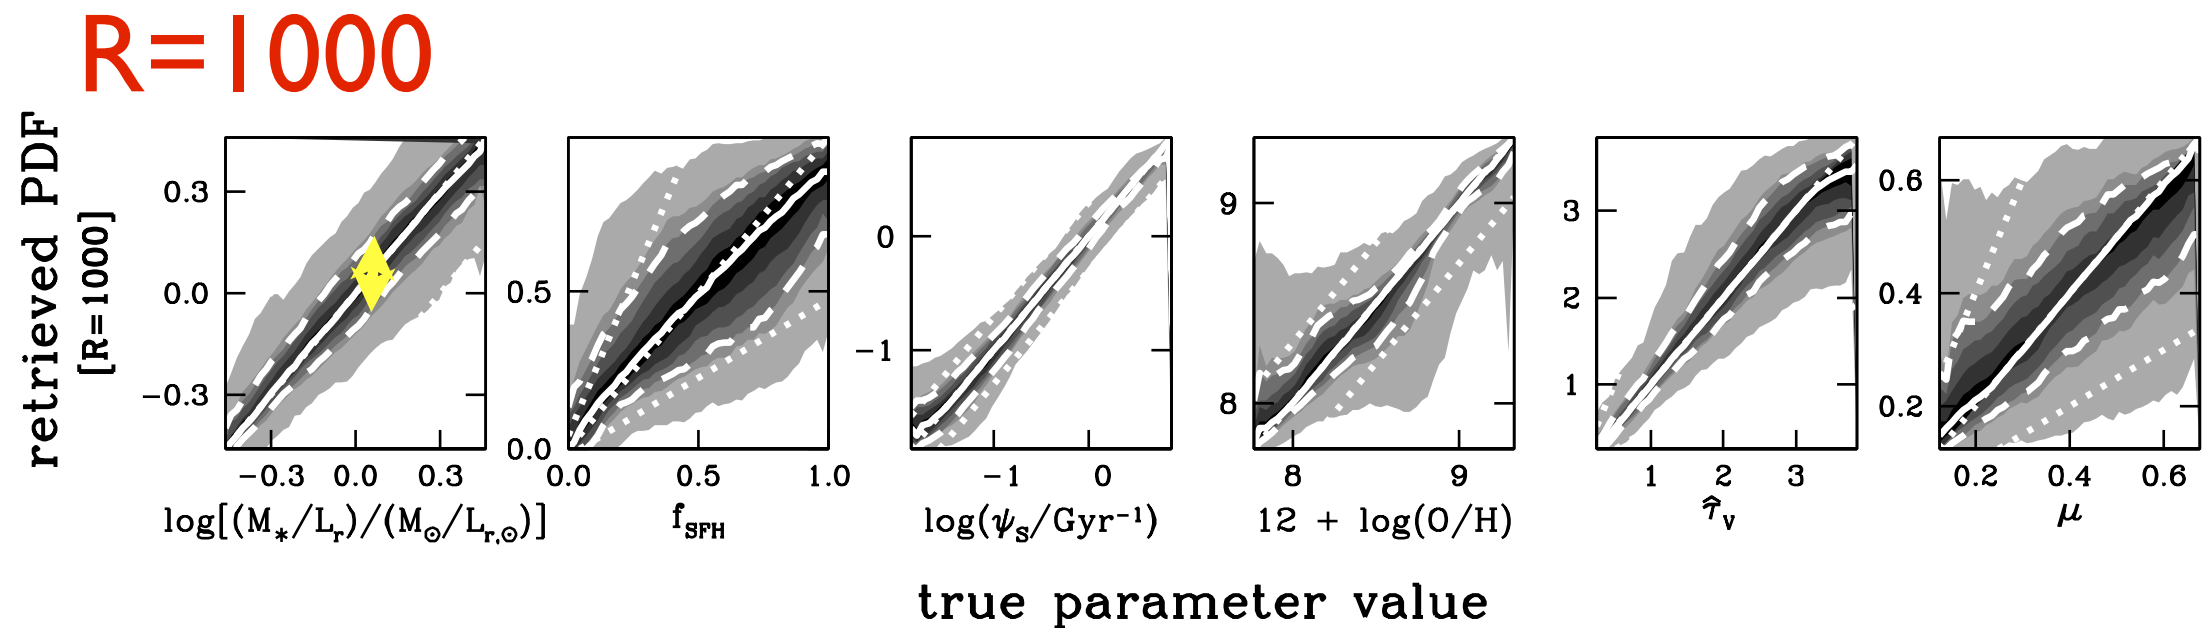

# Parameter retrieval from different types of observations

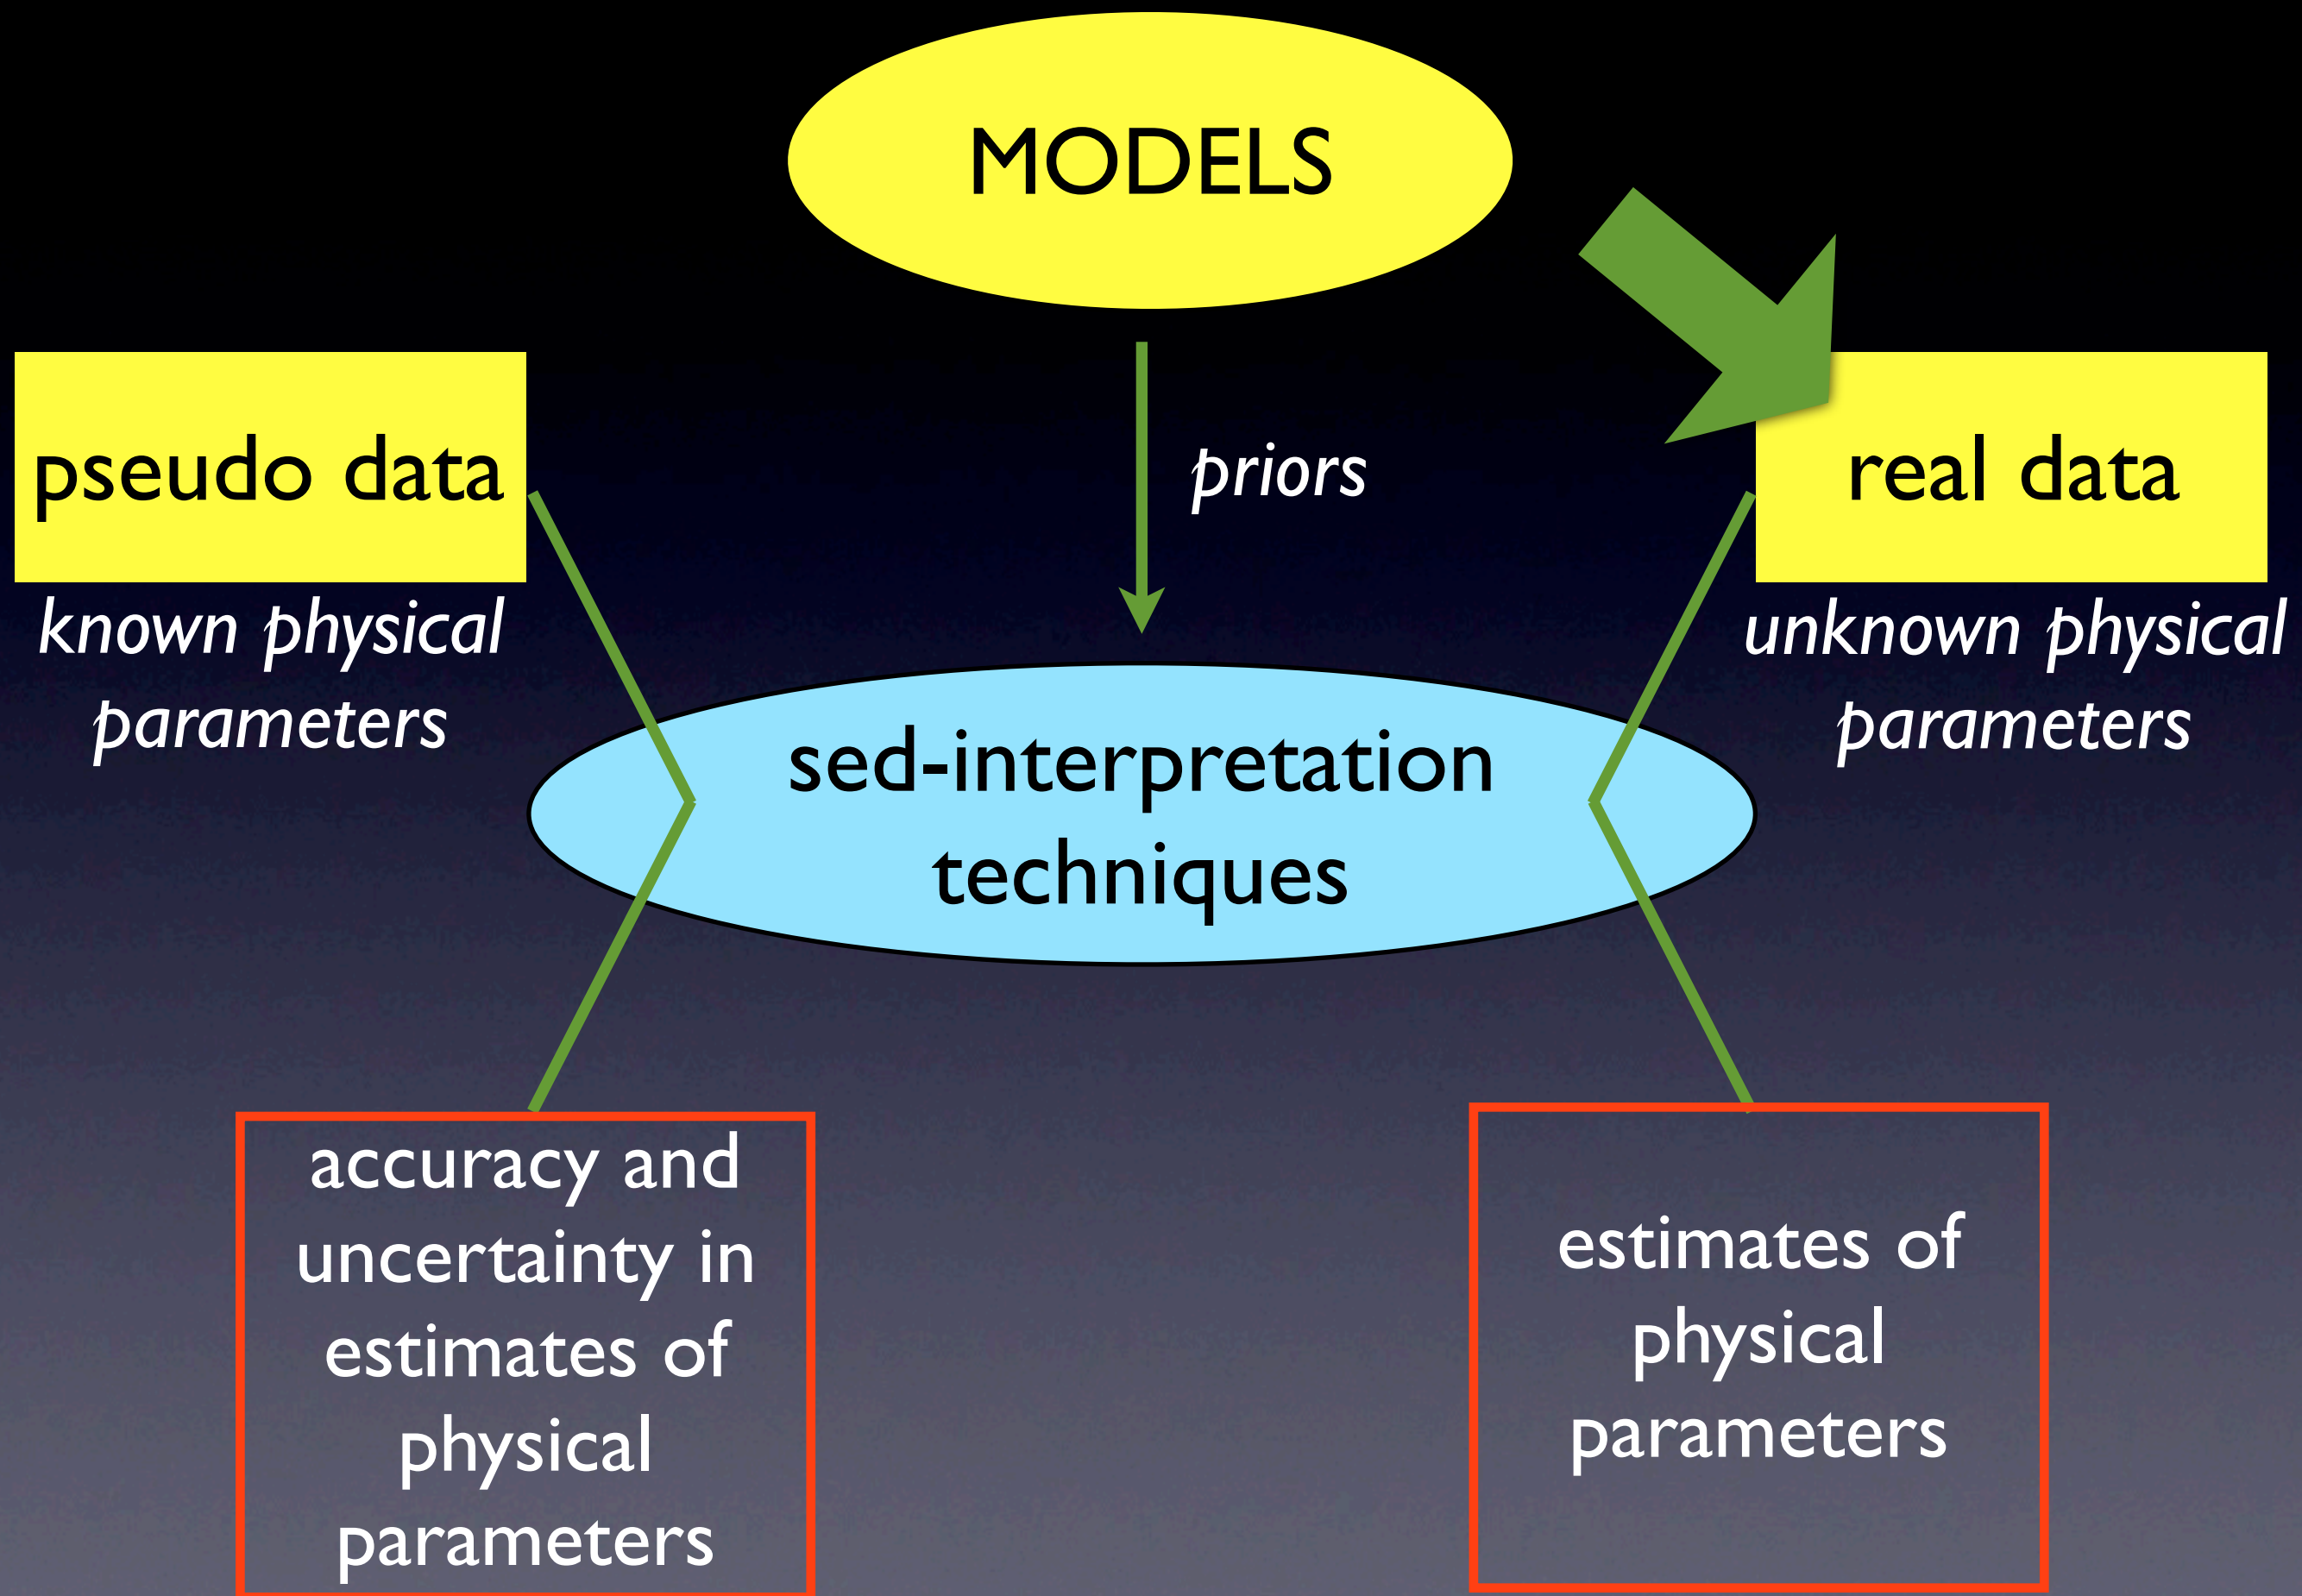

spectral fit medium-resolution ( $R=1000$ ,  $\text{FWHM}=5 \text{ \AA}$ )

$S/N=20$

5,000,000 models, 10,000 pseudo-observations

# Current applications

---

- apply this approach to the analysis of **different types of observations** across the wavelength range covered by spectral evolution models
  - ★ low-redshift **SDSS** galaxies - spectroscopy
  - ★  $0.2 < z < 1.4$  **DEEP2** galaxies - photometry & emission lines
  - ★  $0.7 < z < 3.5$  **3D-HST** galaxies - photometry & grism spectroscopy

# Current applications

---

- apply this approach to the analysis of **different types of observations** across the wavelength range covered by spectral evolution models
  - ★ low-redshift SDSS galaxies - spectroscopy
  - ★  $0.2 < z < 1.4$  **DEEP2** galaxies - photometry & emission lines
  - ★  $0.7 < z < 3.5$  3D-HST galaxies - photometry & grism spectroscopy

# The SFH of galaxies at $z < 1.4$

---

## DEEP2

combine **photometric** and **spectroscopic** observations to assess the “*shape*” of the **star formation history** for different galaxy stellar masses and redshifts

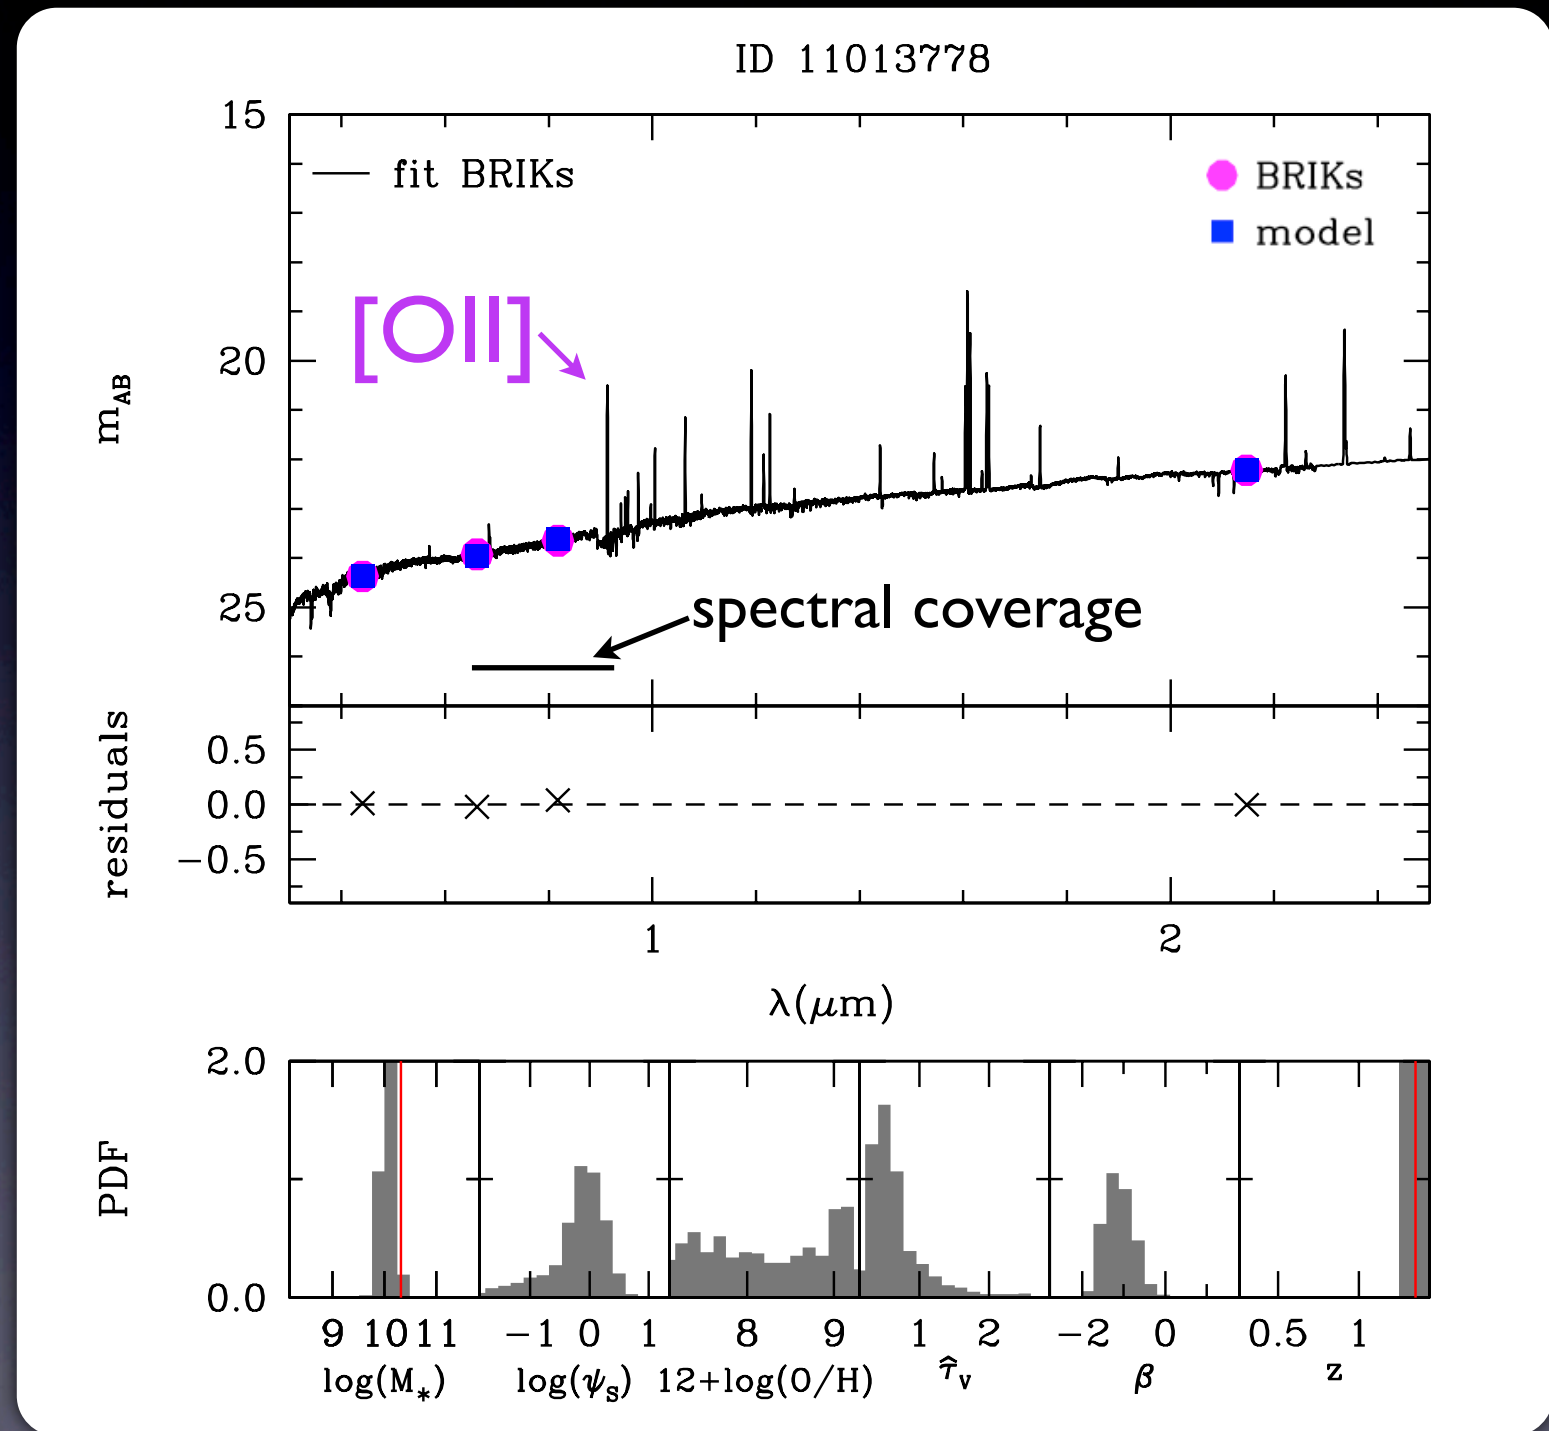

# The SFH of galaxies at $z < 1.4$

DEEP2

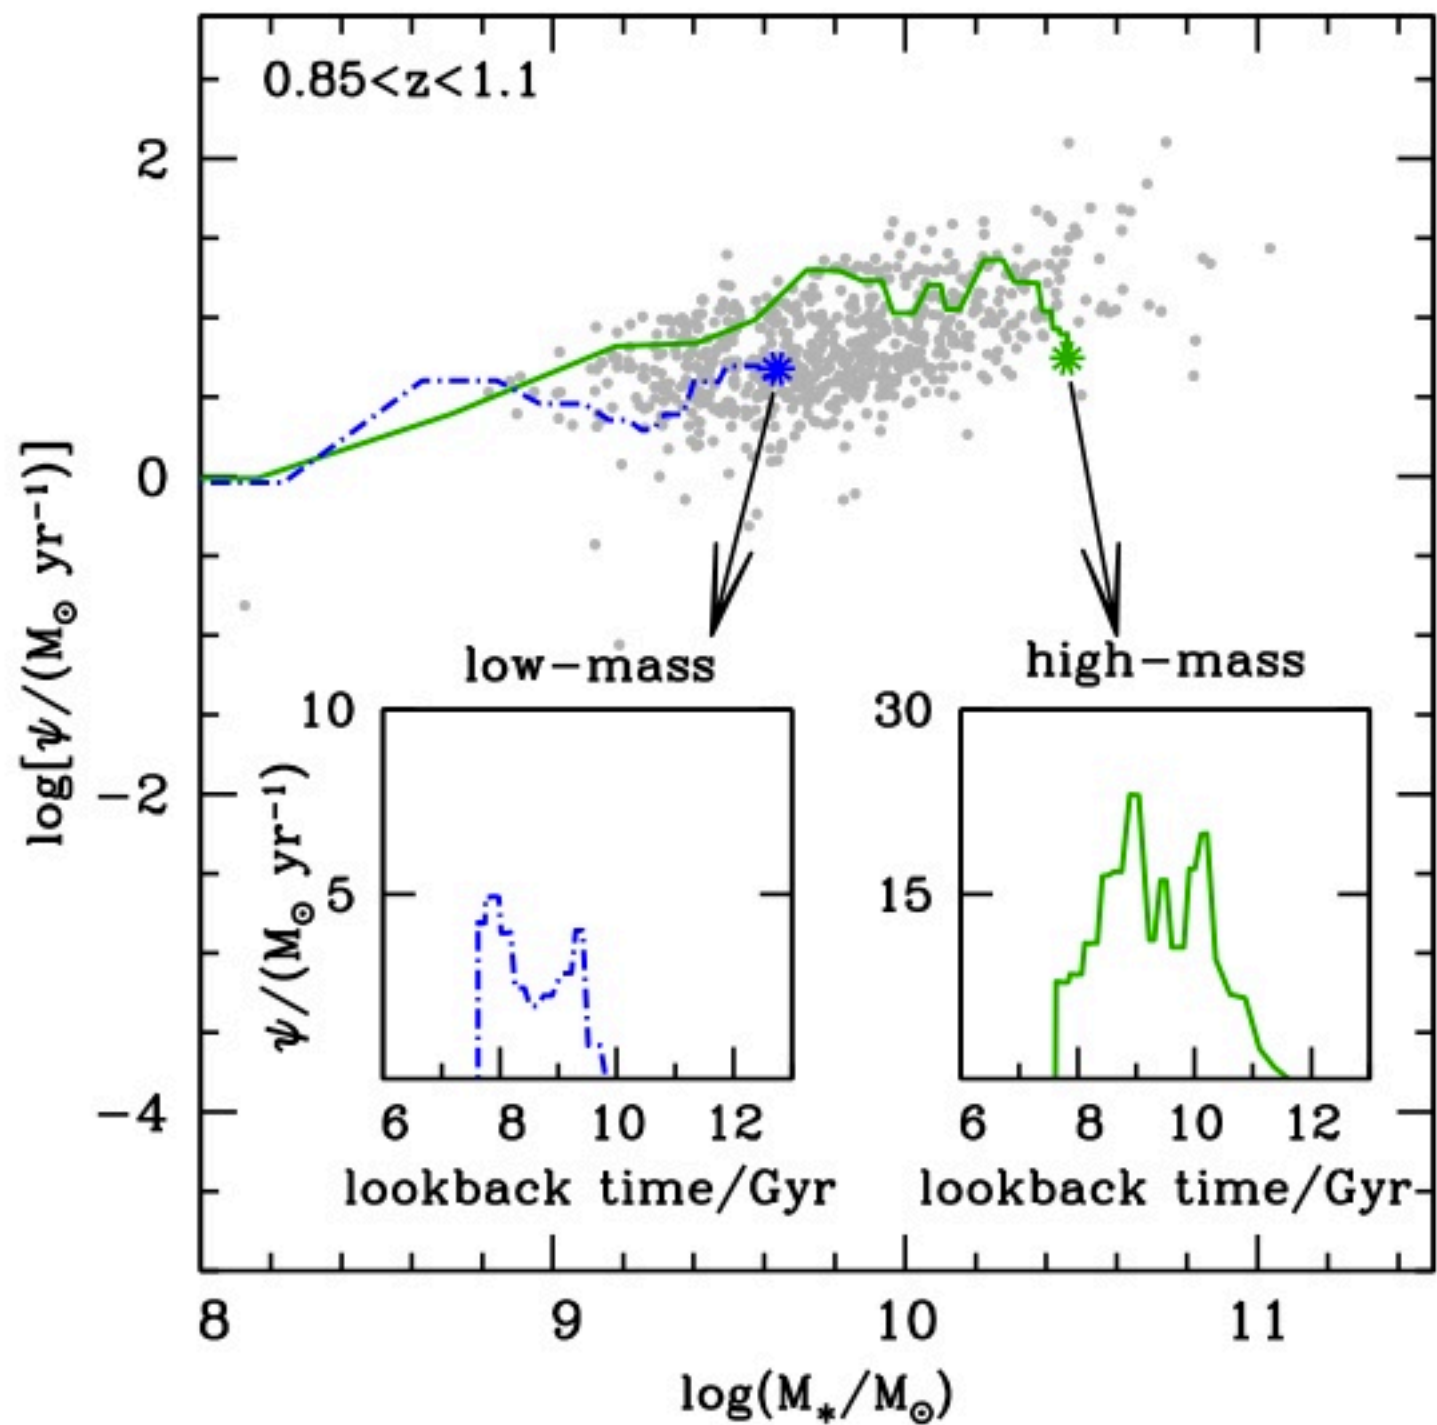

BRIKs

emission-line  
measurements

redshift

# The SFH of galaxies at $z < 1.4$

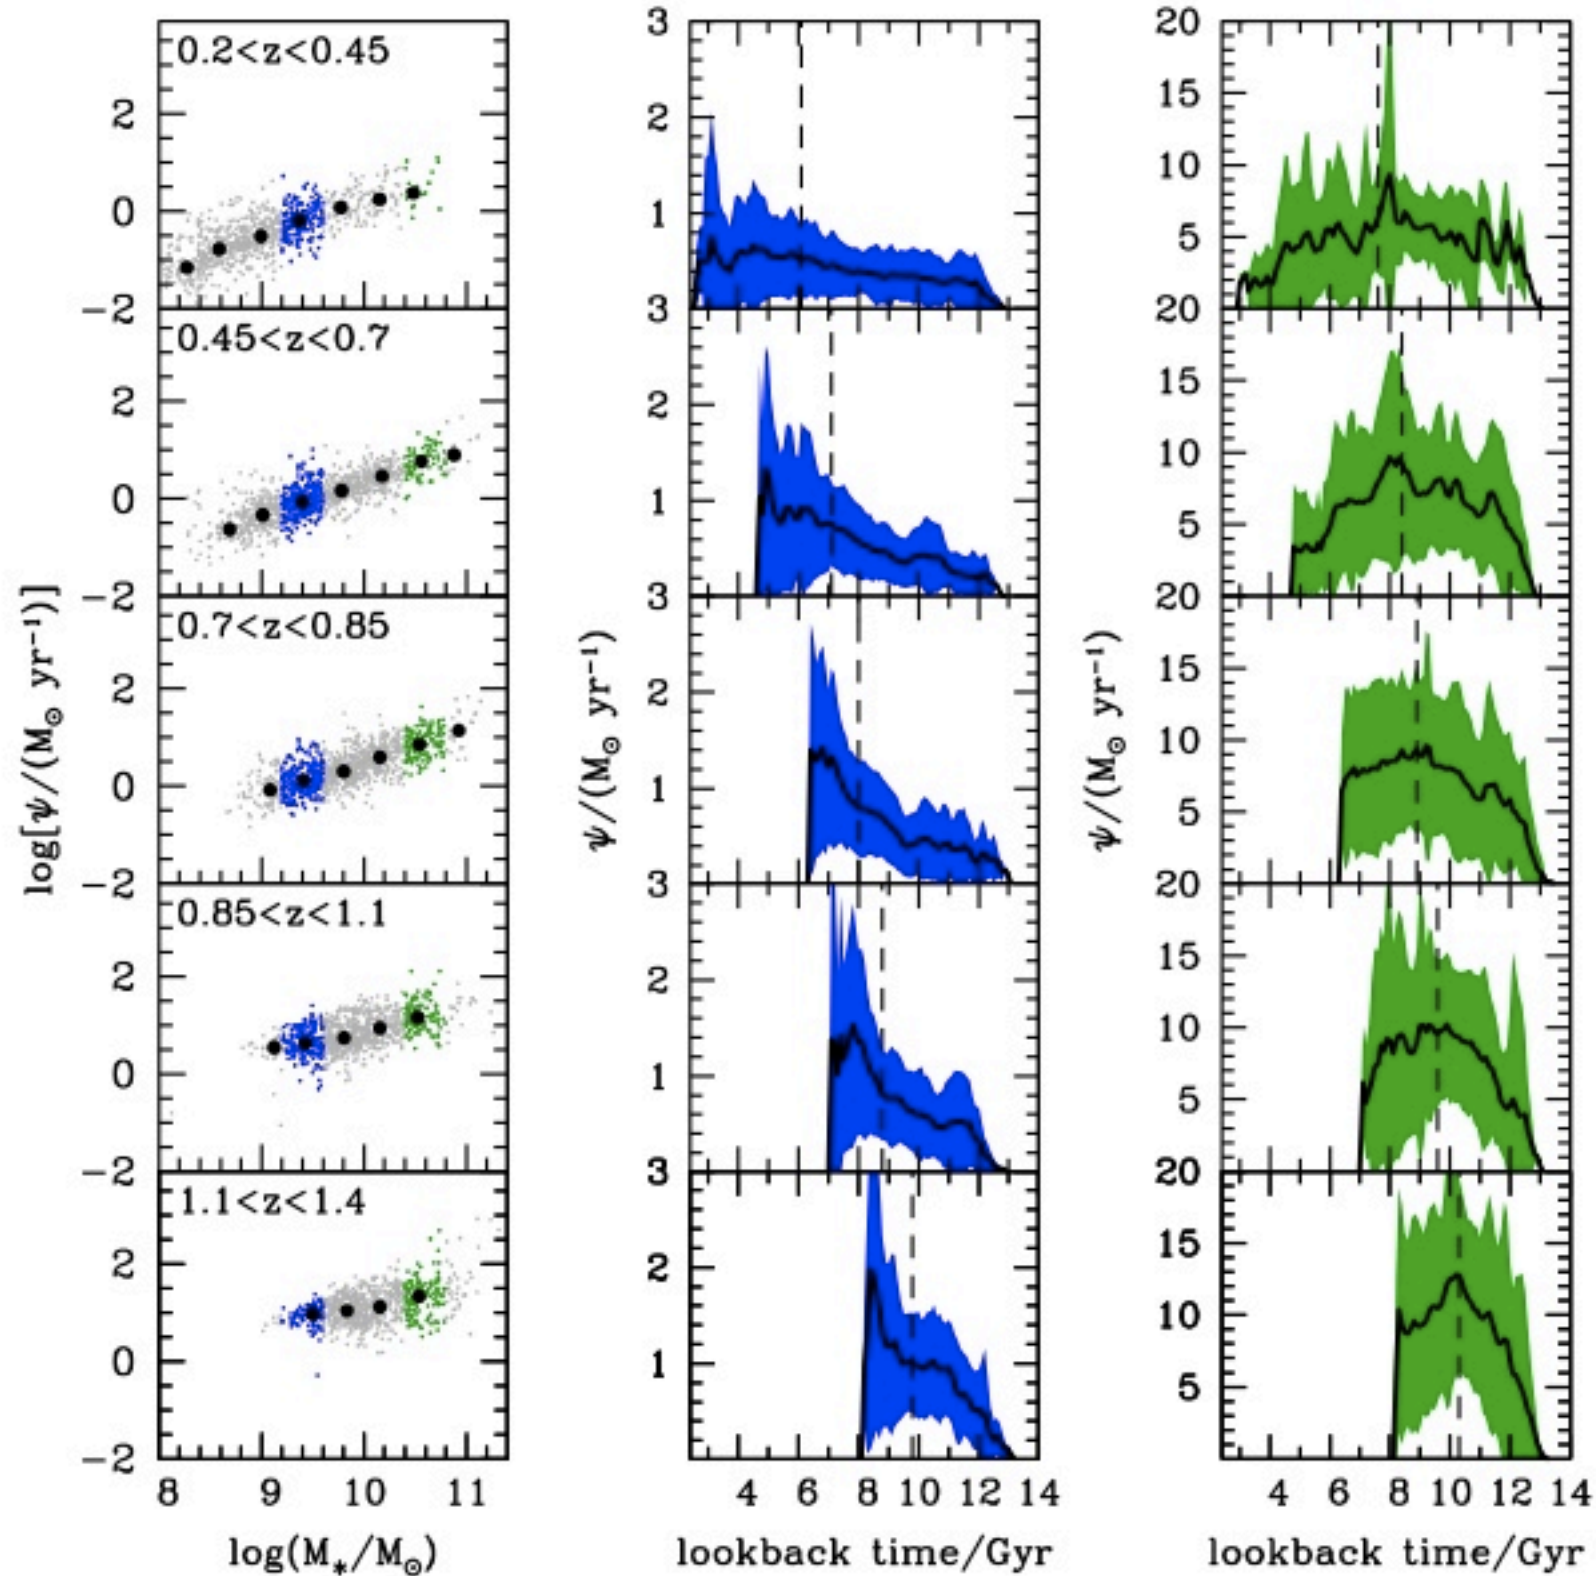

# The SFH of galaxies at $z < 1.4$

SFR  
vs  
stellar mass

# The SFH of galaxies at $z < 1.4$

SFR  
vs  
stellar mass

low-mass galaxies:  
rising SFH

high-mass galaxies:  
bell-shaped SFH

# Summary & Conclusion

---

- Developed **new approach** to assess the relative merits of different types of observations
  - large library of model galaxies covering broad ranges of parameters
  - **pseudo-observations** at different resolutions and signal-to-noise ratios
  - **low-resolution spectroscopy** is very promising
- Applicability of the approach to **any type of observation** to constrain main parameters (SDSS, 3D-HST, DEEP2, HUDF)
- Future
  - explore different **semi-analytic models**
  - extend the models including **dust emission and AGNs**
  - explore the **UV rest frame** (absorption features)

# Thanks
